HISTORY HIGHLIGHTS AND MANUFACTURING PLANTS

DELLA FOGLIA was founded in 1962 by Mr. Guido and Mrs. Amalia Della Foglia as a small artisan company producing ball and needle valves for the domestic market only. During the last 50 years this family owned & managed Company has acquired considerable experience, product knowledge and a high degree of specializations.

The **DELLA FOGLIA** brand is now recognized worldwide for guaranteeing 100% made in Italy high quality products for the oil and gas, petrochemical, power generation and water industries.

The manufacturing plant, based in two different locations (five buildings for a total of 40.000 square meters) is located in Italy, 20 minutes from Milan Malpensa International Airport and 30 minutes from Milan's city centre.

Latest technology CNC machines are real-time connected to the 3D design software and Cad CAM. An ERP system combined with a barcode tracking system are installed to ensure the full traceability of the product from the receipt of raw materials to the shipment. Valves from ½" to 64" are machined internally.

Testing rigs and benches can handle up to 50 tons. An underground bunker complete with cameras and automatic leakage detection systems are used to carry out gas testings, at ambient, high and cryogenic temperature (down to -196°C).

MAIN FEATURES OF BALL VALVES

DOUBLE BLOCK AND BLEED

With this valve design, it is possible to isolate the valve body cavity between two valve seats and to safely drain/vent it, even when the line is in pressure. It is also called “on-line leak detection system” when the ball is in closed position and the body cavity is vented (in proper procedure). This makes it possible to check for seat leakages from the body vent connection. ⁽¹⁾

ANTISTATIC DEVICE

To avoid any dangerous effects caused by static electricity charges, all Della Foggia ball valves incorporate an antistatic device to keep electric continuity between body, stem and ball. This is generally achieved by using springs (stem and/or trunnion to ball) or spring energized balls (stem to body).

ANTI-BLOWOUT STEM

As a safety feature, the valve is designed to avoid the blowout of the stem during the disassembly of the packing when pressure is trapped in the body cavity.

FIRE SAFE DESIGN

To limit leakage in case of fire, our valves are provided with a secondary seal, metallic or graphite based, in all the sealing points. Fire tests according to API 607, API 6FA and EN ISO 10497 have already been performed to certify the entire range of valves.

SELF-RELIEVING SEATS

The self-relieving seats are designed to vent to the line any excessive build-up pressure in the body cavity. Refer to the explanation “Single Piston Effect (self-relieving) vs. Double Piston Effect”.

METAL TO METAL SEAT

In case of high temperature, abrasive and critical services, or highly corrosive fluid the seating surfaces of ball and seats are coated with hard material such as Tungsten carbide, Chrome Carbide or Stellite.

There is no soft insert on the seats and tightness (both at low and high pressure) is ensured by a special shape of the seat and a complex pre-assembly procedure.

Note (1) The Double Block and Bleed test as per API 6D XXIII ed. par B10 (simultaneous pressure from both sides) can be carried out upon request as a supplementary test.

MAIN FEATURES OF BALL VALVES

SINGLE PISTON EFFECT SEAT AND DOUBLE PISTON EFFECT SEAT

In the single piston effect seat design, the pressure in the line energizes the seat and presses it towards the ball. The pressure in the body cavity pushes the seat in the opposite direction venting it automatically (a single effect seat is also a self relieving seat). In the double piston effect seat design, both the pressure in the line and the pressure in the body cavity energize the seat pressing it towards the ball.

Single piston effect seat (Self-Relieving seat) case A: the pressure in the pipeline (P_p) pushes the seat towards the ball.

Single piston effect seat (Self-Relieving seat) case B: the pressure in the body cavity (P_b) pushes back the seat; the fluid can pass and relieve.

Double piston effect case A: the pressure in the pipeline (P_p) pushes the seat towards the ball.

Double piston effect case B: the seat design permits the pressure in the body cavity (P_b) to push the same seat towards the ball.

MAIN FEATURES OF BALL VALVES

GREASE INJECTION DEVICES

Upon request our valves can be equipped with grease injection devices on stem and/or seats. This feature pumps sealant to restore tightness in case of damaged sealing materials in the stem area or in the seat area.

The injection devices are very helpful as preventive maintenance as well as preservation procedure (refer to our product manual). Della Foglia can provide a wide range of products for flushing, lubricating, greasing and sealing.

LINING

The ball valve's internal wetted parts can undergo a special coating process which protects the components with an epoxy film (thickness may be up to 1500 mic). This process may help in case of high corrosion.

EXTENDED BONNET

Extended bonnets are used in either high or low temperature applications in order to move the stem sealing packing as far as possible from the fluid (which is at low/high temperature).

The extension length is calculated by Della Foglia engineers based on the actual service conditions or can be adjusted based on the customer's specifications.

STEM EXTENSIONS

Stem extensions bring at the requested height all the operation features, such as gears actuators, sealant injectors, vent and drain valves etc. They are normally requested when the valves are installed in underground line.

WELD OVERLAYS

When it is required to improve the corrosion resistance of the base material and/or the mechanical performances of a component, it is possible to place a weld overlay of CRA materials (stainless steel or incoloy) on the sealing areas only or on all the wetted parts.

The parts undergo a pre-machining process, followed by the welding activity and the final machining. The welding is carried out by qualified welders and it is controlled by certified NDE personnel.

LOW EMISSION VALVES

Use of special seals and the accurate machining of stem and bonnet sealing areas ensure the compliance with the "low fugitive emission" regulations. Specially designed stem and body joint seals, available upon request, satisfy the most stringent fugitive emission requirements also in low and high temperature.

We can provide several types of sealing systems which vary from multiple elastomers, pressure energized seals, mechanically energized seals and metallic seals.

APPLICABLE STANDARDS

The design, manufacturing and testing of Della Foglia Ball valves are generally in accordance with the following standards, however, we can provide tailor made products based on any kind of specification or international standard.

PRODUCT RANGE

BOLTED BODY SIDE ENTRY BALL VALVES

Trunnion side entry ball valve is the most popular ball valve design for Oil & Gas application. The ball is held on a fixed vertical axis and is free to rotate about it. Sealing is assured by pressure & spring energized seats.

The body can be 2 or 3 bolted pieces. For small sizes, the ball is supported by a Trunnion, while for large sizes trunnion plates are used. Valves are designed in accordance with the most recognized international standards as well as the applicable customer specifications.

Body material may vary from carbon steel, stainless steel, duplex stainless steel and any exotic alloy. Various solutions are available for body seals and seats including true metal-to-metal contact sealing.

TECHNICAL FEATURES

Standard Features	Optional features
<ul style="list-style-type: none"> • Design according to API 6D, ISO 17292, B16.34, ASME VIII • Ends according to ASME B16.5, B16.25 • Anti blow out stem • Antistatic device • Double block and bleed • Self relieving (only if trunnion type) • Fire safe according to ISO 10497, API 607, API 6FA, BS 6755-2 	<ul style="list-style-type: none"> • Ends according to custom design • Double piston effect seats • One seat self relieving and one seat double piston effect • Emergency sealant injection on seat and/or stem sealings • Bonnet extension • Stem extension • Metal to metal seat • Body Lining • Weld overlay on seat pocket or and stem pocket area • Weld overlay on wetted parts

PRODUCT RANGE

WELDED BODY BALL VALVES / UNDERGROUND

Fully welded ball valves are characterized by body fabricated by welding of forged rings.

The result is a solid assembly with no leakage paths.

A fully welded application is a preferable solution when no maintenance is scheduled on valves and when it is mandatory to avoid any external leakage.

A typical application is for underground valves.

Welding is performed by highly qualified professionals, in accordance with all applicable ASME requirements.

The same options and features of side entry Trunnion ball valves are available for fully welded ball valves as well.

TECHNICAL FEATURES

Standard Features	Optional features
<ul style="list-style-type: none"> • Design according to API 6D, ISO 17292, B16.34, ASME VIII • Ends according to ASME B16.5, B16.25 • Anti-blowout stem • Antistatic device • Double block and bleed • Self relieving (only if trunnion type) • Fire safe according to ISO 10497, API 607, API 6FA, BS 6755-2 	<ul style="list-style-type: none"> • Ends according to custom design • Double piston effect seats • One seat self relieving and one seat double piston effect • Emergency sealant injection on seat and/or stem sealings • Stem extension • Metal to metal seat • Body Lining • Weld overlay on seat pocket and/or stem pocket area • Weld overlay on all wetted parts

PRODUCT RANGE

TOP ENTRY BALL VALVES

Top Entry ball valve design is characterized by one piece body construction with top access to all internal components. Top Entry Ball Valves are the preferable solution when it is required to perform in line maintenance, and when the reduction of possible leakage path is mandatory. The body could be manufactured from forged billet or high quality castings. Same options and features of side entry Trunnion ball valve are available also for top entry ball valves.

TECHNICAL FEATURES

Standard Features	Optional features
<ul style="list-style-type: none"> • Design according to API 6D, ISO 17292, B16.34, ASME VIII • Ends according to ASME B16.5, B16.25 • Anti-blowout stem • Antistatic device • Double block and bleed • Self relieving (only if trunnion type) • Fire safe according to ISO 10497, API 607, API 6FA, BS 6755-2 	<ul style="list-style-type: none"> • Ends according to custom design • Double piston effect seats • One seat self relieving and one seat double piston effect • Emergency sealant injection on seat and/or stem sealings • Stem extension • Bonnet extension • Metal to metal seat • Body Lining • Weld overlay on seat pocket and/or stem pocket area • Weld overlay on all wetted parts

PRODUCT RANGE

SUBSEA VALVES

Della Foglia is one of the first worldwide companies to reach API 6DSS qualification for subsea pipeline ball valves. This proves the capability of Della Foglia to manufacture such critical products.

Special design is developed for each application in order to guarantee the required performance level for the whole predicted life of the valve.

A high level quality control inspection & test, as well as advanced design tools (finite element simulation, fatigue analysis, fluidodynamic study etc.) contribute to the increase in performance of the valves.

An internal testing facility is available to perform hydrostatic and gas tests up to 1000bar pressure.

TECHNICAL FEATURES

Standard Features	Optional features
<ul style="list-style-type: none"> • Design according to API 6DSS, ISO 17292, B16.34, ASME VIII • Ends according to ASME B16.5, B16.25 • Anti-blowout stem • Antistatic device • Double block and bleed • Self relieving (only if trunnion type) • Fire safe according to ISO 10497, API 607, API 6FA, BS 6755-2 	<ul style="list-style-type: none"> • Ends according to custom design • Double piston effect seats • One seat self relieving and one seat double piston effect • Emergency sealant injection on seat and/or stem sealings • Stem extension • Bonnet extension • Metal to metal seat • Body Lining • Weld overlay on seat pocket and/or stem pocket area • Weld overlay on wetted parts

PRODUCT RANGE

DOUBLE BALL VALVES

Double Ball Valves are basically made up of two ball valves in one solid body. They provide two physical barriers against downstream leakages with a very compact pattern.

Double ball valves are available in both floating and trunnion mounted configuration. Different body constructions are available: one piece body (cartridge type), bolted body and fully welded body.

A center bleed port between the valves allows testing of valve's performance, and provides a "double block and bleed" feature with maximum safety.

TECHNICAL FEATURES

Standard Features	Optional features
<ul style="list-style-type: none"> • Design according to API 6D, ISO 17292, B16.34, ASME VIII • Ends according to ASME B16.5, B16.25 • Anti-blowout stem • Antistatic device • Self relieving (only if trunnion type) • Fire safe according to ISO 10497, API 607, API 6FA, BS 6755-2 	<ul style="list-style-type: none"> • Ends according to custom design • Double piston effect seats (only if trunnion type) • Emergency sealant injection on seat and/or stem sealings • Stem extension • Bonnet extension • Metal to metal seat • Body Lining • Weld overlay on seat pocket or and stem pocket area • Weld overlay on wetted parts

Floating ball valves have a simple structure: the ball is supported by the seats but can float inside the valve body.

Under medium pressure, the ball drifts towards the downstream side pushing against the seat ensuring sealing reliability.

The range of Della Foglia Floating ball valves includes side entry, bolted body or threaded body, and the special top entry design.

Materials of construction are carbon steel, stainless steel or any exotic alloy.
